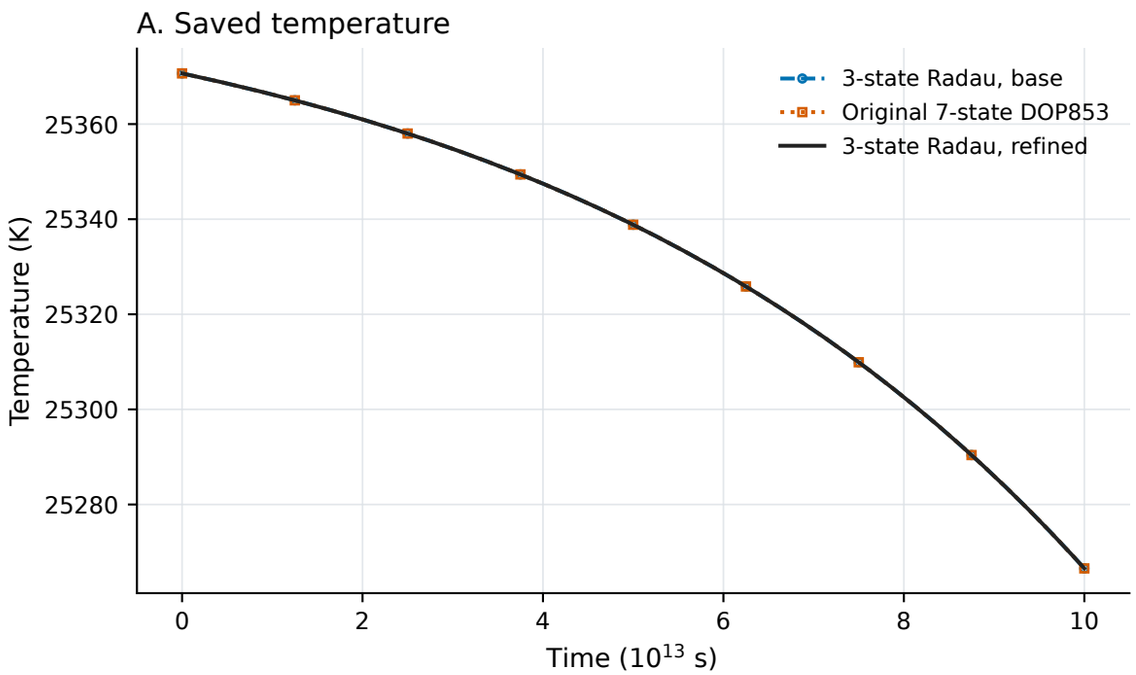
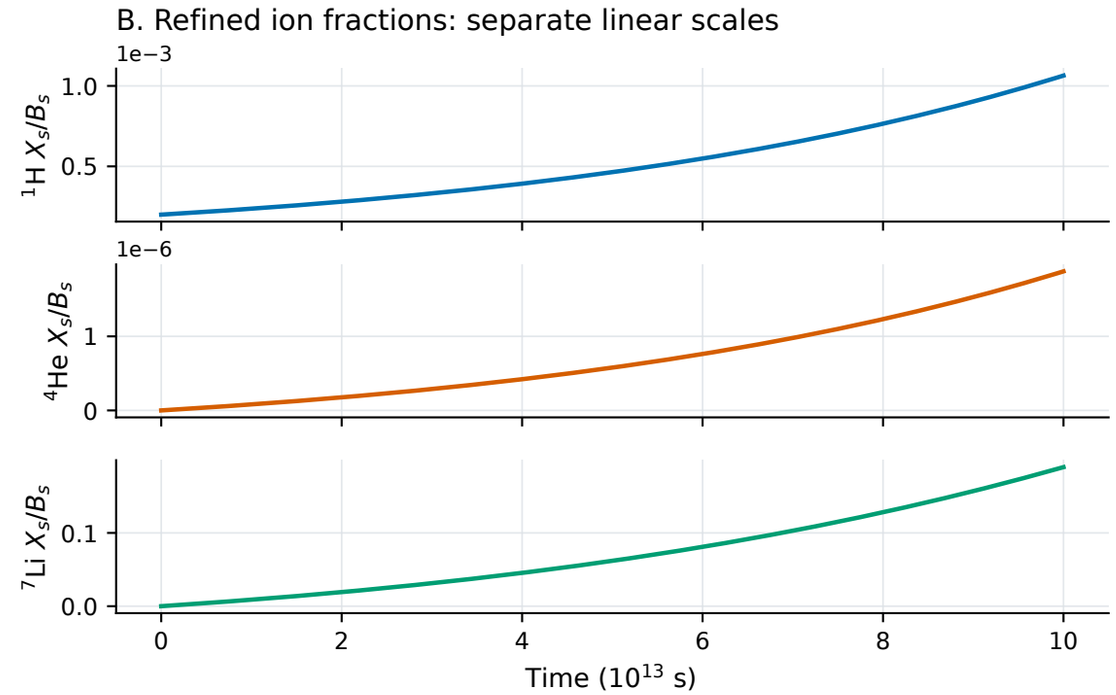
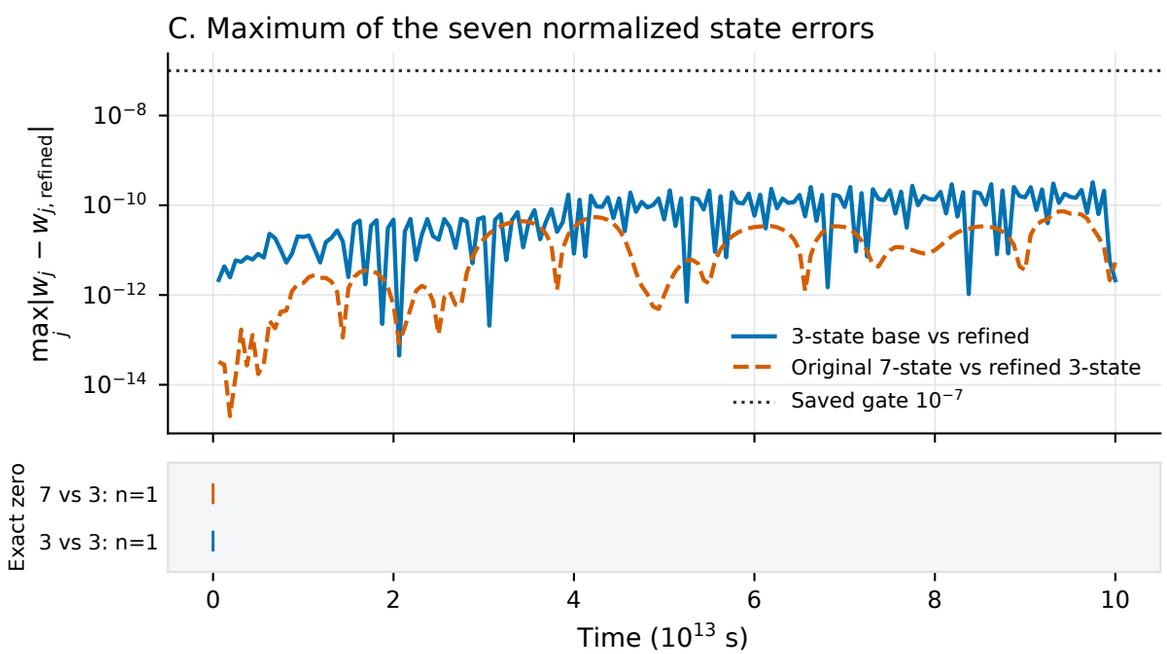
Saved CI-only parcel evolution and coordinate comparisons

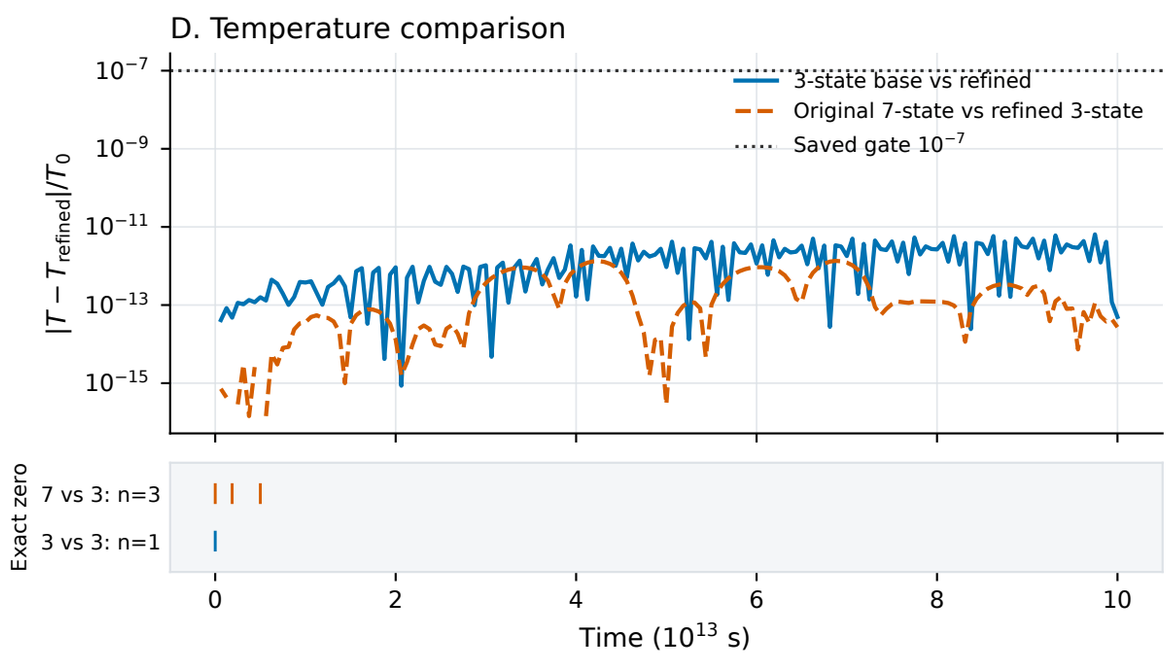
T0 = 25370.7 K | nref = 0.001 cm^-3 | saved cohort: PASS_SCOPED

Fixed density; shared thermal reservoir; finite CI only. Ion fractions use each species' own total abundance.









Normalized state: $w = (N_s/B_s,\ X_s/B_s,\ u/u_0)$. Original 7-state coordinates are saved without conservation projection.

Only positive errors appear on log axes; exact zeros are separate ticks with counts. No positive floor or smoothing is applied.

Comparisons use the saved common sample grid. The gate concerns these samples; it is not a continuum or physical-model accuracy certificate.
